joint work with

**Jelena Ignjatović, Branimir Šešelja, Andreja Tepavčević**

Eleventh International Conference on Fuzzy Set Theory and Applications  
January 30 - February 3, 2012, Liptovský Ján, Slovak Republic

## Introduction

### Eigen fuzzy set equations

first studied by *Sanchez (FSS, 1978; JMAA, 1981)* – used in medical research  
later they were studied in many papers and found a much wider field of application

*Wagenknecht, Hartmann (FSS, 1986)*

construction of fuzzy eigen solutions in a given region (interval)

*Jimenez, Montes, Šešelja, Tepavčević (CAMWA, 2011)*

### Our approach

we study both equations and inequalities

we study systems of equations (inequalities), not only single equations (inequalities)

we use more general structure of truth values (complete residuated lattice)

- » differences between systems of inequalities and systems of equations
- » differences between systems of equations and single equations
- » connections with closures and openings w.r.t. fuzzy relations (fuzzy quasi-orders)
- » algorithms for computing the greatest and the least solutions

## Fuzzy sets

## Structure of truth values

complete residuated lattice:  $\mathcal{L} = (L, \vee, \wedge, \otimes, \rightarrow, 0, 1)$

negation – unary operation  $\neg$  defined by  $\neg x = x \rightarrow 0$

double negation property:  $x = \neg\neg x$ , for all  $x \in L$

complete residuated lattices **do not have** this property in general

*MV-algebras* satisfy the double negation property

## Fuzzy sets

$L^A = \{f \mid f : A \rightarrow L\}$  – the set of all fuzzy subsets of a set  $A$  over  $\mathcal{L}$

$\mathcal{F}(A) = (L^A, \vee, \wedge, \emptyset, A)$  – the complete lattice of fuzzy subsets of  $A$

**complement**  $f^\neg$  of a fuzzy subset  $f$ :  $f^\neg(x) = \neg f(x)$ , for each  $x \in L$

**scalar multiplication**  $\lambda f$  ( $= f\lambda$ ) of  $f \in L^A$  and  $\lambda \in L$ :  $\lambda f(a) = \lambda \otimes f(a)$ , for each  $a \in A$ .

$f \in L^A$  is a **linear combination** of  $f_i \in L^A$  ( $i \in I$ ) if there are  $\lambda_i \in L$  ( $i \in I$ ) such that

$$f = \bigvee_{i \in I} \lambda_i f_i.$$

## Fuzzy sets (cont.)

## Closure and opening systems

*closure system* in  $\mathcal{F}(A)$  – a subset of  $L^A$  containing  $A$ , closed under arbitrary meets

*opening system* in  $\mathcal{F}(A)$  – a subset of  $L^A$  containing  $\emptyset$ , closed under arbitrary joins

$(P, \leq)$  – partially ordered set. A function  $\phi : P \rightarrow P$  is

- *isotone* if  $x \leq y$  implies  $\phi(x) \leq \phi(y)$ , for all  $x, y \in P$ ;
- *extensive* if  $x \leq \phi(x)$ , for each  $x \in P$ ;
- *intensive* if  $\phi(x) \leq x$ , for each  $x \in P$ ;
- *idempotent* if  $\phi(\phi(x)) = \phi(x)$ , for each  $x \in P$ .

*closure operator* on  $(P, \leq)$  – *isotone*, *extensive* and *idempotent* function

if  $\phi(x) = x$ , then  $x$  is a  *$\phi$ -closed element*

*opening operator* on  $(P, \leq)$  – *isotone*, *intensive* and *idempotent* function

if  $\phi(x) = x$ , then  $x$  is a  *$\phi$ -open element*

**closure system** in  $\mathcal{F}(A) \equiv$  set of all closed elements of some **closure operator** on  $\mathcal{F}(A)$

**opening system** in  $\mathcal{F}(A) \equiv$  set of all open elements of some **opening operator** on  $\mathcal{F}(A)$

## Fuzzy sets (cont.)

## Closure and opening systems (cont.)

$C \subseteq L^A$  – closure system in  $\mathcal{F}(A)$ ,  $X = \{f_i\}_{i \in I} \subseteq L^A$

*C-closure* of  $X$ :

$$C_X = \bigwedge \{g \in C \mid f_i \leq g, \text{ for every } i \in I\} \in C$$

– the least element of  $C$  containing all members of  $X$ .

*principal element* of  $C$  generated by an element  $a \in A$ :

$$C_a = \bigwedge \{f \in C \mid f(a) = 1\} \in C$$

– the  $C$ -closure of the crisp subset  $\{a\}$  of  $A$

*principal part* of  $C$ :  $\mathcal{P}(C) = \{C_a \mid a \in A\}$

$C \subseteq L^A$  – opening system in  $\mathcal{F}(A)$ ,  $X = \{f_i\}_{i \in I} \subseteq L^A$

*C-opening* of  $X$ :

$$C_X = \bigvee \{g \in C \mid g \leq f_i, \text{ for every } i \in I\} \in C$$

– the greatest element of  $C$  contained in all members of  $X$

## Fuzzy relations

## Fuzzy relations

$L^{A \times A} = \{f \mid f : A \times A \rightarrow L\}$  – the set of all fuzzy relations on a set  $A$  over  $\mathcal{L}$

$\mathcal{R}(A) = (L^{A \times A}, \vee, \wedge, \emptyset, A \times A)$  – the complete lattice of fuzzy relations on  $A$

$R^{-1} \in \mathcal{R}(B, A)$  – *converse* (*inverse*, *transpose*) of a fuzzy relation  $R \in \mathcal{R}(A, B)$

$$R^{-1}(b, a) \stackrel{\text{def}}{=} R(a, b) \quad (a \in A, b \in B)$$

## Compositions

$R \circ S$  – *composition of fuzzy relations*  $R, S \in L^{A \times A}$ :

$$(R \circ S)(a, c) = \bigvee_{b \in A} R(a, b) \otimes S(b, c) \quad (a, c \in A)$$

$f \circ R, R \circ f$  – *compositions of a fuzzy relation*  $R \in L^{A \times A}$  *and a fuzzy set*  $f \in L^A$ :

$$(f \circ R)(a) = \bigvee_{b \in A} f(b) \otimes R(b, a), \quad (R \circ f)(a) = \bigvee_{b \in A} R(a, b) \otimes f(b), \quad (a \in A)$$

*n-th power*  $R^n$  of a fuzzy relation  $R$ :  $R^0 = \Delta_A, R^1 = R, R^{n+1} = R^n \circ R$  ( $n \in \mathbb{N}^0$ ).

## Fuzzy quasi-orders, fuzzy equivalences

### Fuzzy quasi-orders, fuzzy equivalences

$R \in L^{A \times A}$  – fuzzy relation

*reflexive* –  $R(a, a) = 1$ , for all  $a \in A$ ,  $\Leftrightarrow \Delta_A \leq R$

*symmetric* –  $R(a, b) = R(b, a)$ , for all  $a, b \in A$ ,  $\Leftrightarrow R^{-1} \leq R$

*transitive* –  $R(a, b) \otimes R(b, c) \leq R(a, c)$ , for all  $a, b, c \in A$ ,  $\Leftrightarrow R \circ R \leq R$

*fuzzy quasi-order* – *reflexive* and *transitive* (fuzzy preorder, in some sources)

*fuzzy equivalence* – *reflexive*, *symmetric* and *transitive*

$Q$  – fuzzy quasi-order,  $Q \wedge Q^{-1}$  – natural fuzzy equivalence of  $Q$

$Q(A)$  – complete lattice of fuzzy quasi-orders on  $A$

$\mathcal{E}(A)$  – complete lattice of fuzzy equivalences on  $A$

## Fuzzy quasi-orders, fuzzy equivalences (cont.)

## Closures of fuzzy relations

 $R \in L^{A \times A}$  – fuzzy relation $R^t = \bigvee_{n \in \mathbb{N}} R^n$  – *transitive closure* of  $R$  (the least transitive fuzzy relation containing  $R$ )

$$|A| = n - R^t = \bigvee_{k=1}^n R^k, \quad R \text{ is reflexive} - R^t = R^{n-1}$$

 $R^r = R \vee \Delta_A$  – *reflexive closure* of  $R$  $R^s = R \vee R^{-1}$  – *symmetric closure* of  $R$  $R^q = (R^r)^t = (R^t)^r$  – *fuzzy quasi-order closure* of  $R$ *(reflexive-transitive closure,  $Q(A)$ -closure)* $R^e = ((R^r)^s)^t = ((R^s)^r)^t = ((R^s)^t)^r$  – *fuzzy equivalence closure* of  $R$ *(symmetric-reflexive-transitive closure,  $Q(A)$ -closure)*

## Transitive closure – efficient algorithms

- Naessens, De Meyer, De Baets, IEEE Trans. Fuzzy Systems 10 (2002) 541–551.  
t-norm based structures –  $O(n^3)$
- De Meyer, Naessens, De Baets, EJOR 155 (2004) 226–238.  
Gödel structure –  $O(n^2)$

## Fuzzy quasi-orders, fuzzy equivalences (cont.)

**Aftersets, foresets, equivalence classes**

$R \in L^{A \times A}$  – fuzzy relation

*R*-afterset of  $a \in A$  is  $aR \in L^A$  defined by:  $(aR)(b) = R(a, b)$ , for any  $b \in A$ ,

*R*-foreset of  $a$  is  $Ra \in L^A$  defined by:  $(Ra)(b) = R(b, a)$ , for any  $b \in A$ .

$R$  is symmetric iff  $aR = Ra$ , for each  $a \in A$ ;

if  $E$  is a fuzzy equivalence, we write  $E_a$  instead of  $aE = Ea$ ;

$E_a$  – *equivalence class* of  $a$  w.r.t.  $E$

if  $|A|$  is finite – *aftersets*  $\equiv$  *row vectors*, *foresets*  $\equiv$  *column vectors*

## Fuzzy relations (cont.)

## Residuals of fuzzy sets by fuzzy relations

$R \in L^{A \times A}$  – fuzzy relation,  $f \in L^A$  – fuzzy subset

*left residual*  $f/R \in L^A$  of  $f$  by  $R$ :

$$(f/R)(a) = \bigwedge_{b \in A} R(a, b) \rightarrow f(b) = \bigwedge_{b \in A} (aR)(b) \rightarrow f(b), \quad (a \in A)$$

*right residual*  $R \setminus f \in L^A$  of  $f$  by  $R$ :

$$(R \setminus f)(a) = \bigwedge_{b \in A} R(b, a) \rightarrow f(b) = \bigwedge_{b \in A} (Ra)(b) \rightarrow f(b), \quad (a \in A)$$

*concepts conjugated with compositions:*

$$f \circ R \leq g \Leftrightarrow f \leq g/R, \quad R \circ f \leq g \Leftrightarrow f \leq R \setminus g$$

if  $R$  is symmetric, then  $f/R = R \setminus f$ , for each  $f \in L^A$

## Fuzzy quasi-orders, fuzzy equivalences (cont.)

## Theorem (Bodenhofer (2003), Bodenhofer, De Cock, Kerre (2003))

Let  $R$  be an arbitrary fuzzy relation on a set  $A$ . Then

(a) Functions

$$f \mapsto f \circ R, \quad f \mapsto f/R, \quad f \mapsto R \circ f, \quad f \mapsto R \setminus f \quad (1)$$

are *isotone* functions of the lattice  $\mathcal{F}(A)$  into itself.

- (b) If  $R$  is *reflexive*, then functions  $f \mapsto f \circ R$  and  $f \mapsto R \circ f$  are *extensive*, and functions  $f \mapsto f/R$  and  $f \mapsto R \setminus f$  are *intensive*.
- (c) If  $R$  is a *fuzzy quasi-order*, then all functions in (1) are *idempotent*.

In other words, If  $R$  is a *fuzzy quasi-order*, then

$f \mapsto f \circ R$  and  $f \mapsto R \circ f$  are *closure operators* on  $\mathcal{F}(A)$ ;

$f \mapsto f/R$  and  $f \mapsto R \setminus f$  are *opening operators* on  $\mathcal{F}(A)$ .

## Systems with left compositions and residuals

## Notation

$\Sigma_i$  ( $i \in I$ ) – system of fuzzy relation inequalities or equations

$\langle \Sigma_i \mid i \in I \rangle$  – the set of all solutions to this system

if  $I = \{1, \dots, n\}$ , we write  $\langle \Sigma_1, \dots, \Sigma_n \rangle$

$\langle \Sigma \rangle$  – the set of all solutions to a single fuzzy relation inequality or equation  $\Sigma$

## Theorem

Let  $\{R_i\}_{i \in I}$  be a family of fuzzy relations on a set  $A$ , let  $R = \bigvee_{i \in I} R_i$  and  $Q = R^q$ , and let  $f$  denote an unknown fuzzy subset of  $A$ . Then

$$\begin{aligned}\langle f \circ R_i \leq f \mid i \in I \rangle &= \langle f \circ R \leq f \rangle = \langle f \circ Q \leq f \rangle = \langle f \circ Q = f \rangle \\ &= \langle f \leq f/R_i \mid i \in I \rangle = \langle f \leq f/R \rangle = \langle f \leq f/Q \rangle = \langle f = f/Q \rangle\end{aligned}$$

Moreover, these sets consist of all fuzzy subsets of  $A$  that can be represented as **linear combinations of  $Q$ -aftersets**.

## Systems with right compositions and residuals, double systems

## Theorem

Let  $\{R_i\}_{i \in I}$  be a family of fuzzy relations on a set  $A$ , let  $R = \bigvee_{i \in I} R_i$  and  $Q = R^q$ , and let  $f$  denote an unknown fuzzy subset of  $A$ . Then

$$\begin{aligned} \langle R_i \circ f \leq f \mid i \in I \rangle &= \langle R \circ f \leq f \rangle = \langle Q \circ f \leq f \rangle = \langle Q \circ f = f \rangle \\ &= \langle f \leq R \setminus f \mid i \in I \rangle = \langle f \leq R \setminus f \rangle = \langle f \leq Q \setminus f \rangle = \langle f = Q \setminus f \rangle \end{aligned}$$

Moreover, these sets consist of all fuzzy subsets of  $A$  that can be represented as **linear combinations of  $Q$ -foresets**.

## Theorem

Let  $\{R_i\}_{i \in I}$  be a family of fuzzy relations on a set  $A$ , let  $R = \bigvee_{i \in I} R_i$  and  $E = R^e$ , and let  $f$  denote an unknown fuzzy subset of  $A$ . Then

$$\begin{aligned} \langle f \circ R_i \leq f, R_i \circ f \leq f \mid i \in I \rangle &= \langle f \circ R \leq f, R \circ f \leq f \rangle = \langle f \circ E \leq f \rangle \\ &= \langle f \circ E = f \rangle = \langle f \leq f / R_i, f \leq R_i \setminus f \mid i \in I \rangle \\ &= \langle f \leq f / R, f \leq R \setminus f \rangle = \langle f \leq f / E \rangle = \langle f = f / E \rangle \end{aligned}$$

Moreover, these sets consist of all fuzzy subsets of  $A$  that can be represented as **linear combinations of  $E$ -classes**.

## Closedness w.r.t. a fuzzy relation

### R-closed fuzzy subsets

$$R \in L^{A \times A}, f \in L^A$$

$f$  is **left R-closed**:  $f \circ R \leq f$  (iff  $f(a) \otimes R(a, b) \leq f(b)$ , for all  $a, b \in A$ )

other names: **R-closed**, **R-congruent**

Bodenhofer (2003), Bodenhofer, De Cock, Kerre (2003)

$f$  is **right R-closed**:  $R \circ f \leq f$  (iff  $R(a, b) \otimes f(b) \leq f(a)$ , for all  $a, b \in A$ )

**double R-closed** = left R-closed & right R-closed

$R$  is symmetric:  $f$  is left R-closed iff  $f$  is right R-closed – we say just  $f$  is **R-closed**

$E$  is a fuzzy equivalence:  $E$ -closed fuzzy subsets = fuzzy subsets **extensional w.r.t E**

Klawonn (2000)

## Conjugation of systems

## Theorem

Let  $\{R_i\}_{i \in I}$  be a family of fuzzy relations on a set  $A$ , and let  $f$  be an unknown fuzzy subset of  $A$ . Then:

- (i) if  $g \in \langle f \circ R_i \leq f \mid i \in I \rangle$ , then  $g^\neg \in \langle R_i \circ f \leq f \mid i \in I \rangle$ ;
- (ii) if  $g \in \langle R_i \circ f \leq f \mid i \in I \rangle$ , then  $g^\neg \in \langle f \circ R_i \leq f \mid i \in I \rangle$ ;
- (iii) if  $g \in \langle f \circ R_i \leq f, R_i \circ f \leq f \mid i \in I \rangle$ , then  $g^\neg \in \langle f \circ R_i \leq f, R_i \circ f \leq f \mid i \in I \rangle$ .

In addition, if the underlying complete residuated lattice  $\mathcal{L}$  has the **double negation property**, then the opposite implications also hold.

## Closure-opening systems

## Theorem

Let  $\{R_i\}_{i \in I}$  be a family of fuzzy relations on a set  $A$ , let  $R = \bigvee_{i \in I} R_i$ ,  $Q = R^q$  and  $E = R^e$ , and let  $f$  denote an unknown fuzzy subset of  $A$ . Then:

- (i)  $\langle f \circ R_i \leq f \mid i \in I \rangle$ ,  $\langle R_i \circ f \leq f \mid i \in I \rangle$  and  $\langle f \circ R_i \leq f, R_i \circ f \leq f \mid i \in I \rangle$  are both **closure** and **opening systems** in  $\mathcal{F}(A)$ .
- (ii) The principal part of  $\langle f \circ R_i \leq f \mid i \in I \rangle$  consists of all  $Q$ -aftersets.
- (iii) The principal part of  $\langle R_i \circ f \leq f \mid i \in I \rangle$  consists of all  $Q$ -foresets.
- (iv) The principal part of  $\langle f \circ R_i \leq f, R_i \circ f \leq f \mid i \in I \rangle$  consists of all  $E$ -classes.

## Closure and opening operators

### Closure and opening operators

$g \mapsto g^{lc}, g \mapsto g^{rc}, g \mapsto g^{dc}$  – *closure operators* on  $\mathcal{F}(A)$  corresponding to closure systems

$$\langle f \circ R_i \leq f \mid i \in I \rangle, \quad \langle R_i \circ f \leq f \mid i \in I \rangle \quad \text{and} \quad \langle f \circ R_i \leq f, R_i \circ f \leq f \mid i \in I \rangle, \quad (2)$$

$g \mapsto g^{lo}, g \mapsto g^{ro}, g \mapsto g^{do}$  – the corresponding *opening operators*

$g^{lc}, g^{rc}, g^{dc}$  – the *least solutions* to systems in (2) containing  $g$

$g^{lo}, g^{ro}, g^{do}$  – the *greatest solutions* to systems in (2) contained in  $g$

### Theorem (Main Theorem)

Let  $\{R_i\}_{i \in I}$  be a family of fuzzy relations on a set  $A$ , let  $R = \bigvee_{i \in I} R_i$ ,  $Q = R^q$  and  $E = R^e$ , and let  $g$  be an arbitrary fuzzy subset of  $A$ . Then:

$$g^{lc} = g \circ Q, \quad g^{rc} = Q \circ g, \quad g^{dc} = g \circ E, \quad g^{lo} = g / Q, \quad g^{ro} = Q \setminus g, \quad g^{do} = g / E.$$

## Efficient algorithms

## Efficient algorithms (transitive closure)

- » compute  $R = \bigvee_{i \in I} R_i$  and  $R^r$  (or  $(R^r)^s$ );
- » compute the transitive closure of  $R^r$  (or  $(R^r)^s$ );
- » compute the composition of a given fuzzy set  $g$  and  $(R^r)^t$  (or  $((R^r)^s)^t$ ).

computationally the most demanding part – computation of the *transitive closure*  
*work independently of the properties of the underlying structure of truth values*

## Another method (Ignjatović, Ćirić, De Baets)

general method for solving inequalities defined by *residuated* and *residual functions*  
 $f \circ R_i \leq f$  ( $i \in I$ ) – defined by residuated functions  $f \mapsto f \circ R_i$  and  $f \mapsto f$ , and residual functions  $f \mapsto f/R_i$

$$\langle f \circ R_i \leq f \mid i \in I \rangle = \left\langle \bigvee_{i \in I} (f \circ R_i) \leq f \right\rangle = \langle f \leq f/R_i \mid i \in I \rangle = \left\langle f \leq \bigwedge_{i \in I} (f/R_i) \right\rangle$$

computation of the *greatest post-fixed point* or the *least pre-fixed point* of an isotone function on the lattice of fuzzy sets

*iterative procedure* (the number of iterations may be infinite, for some structures)

## Comparison with the systems of inequalities

## Theorem

Let  $\{R_i\}_{i \in I}$  be a family of fuzzy relations on a set  $A$ , let  $R = \bigvee_{i \in I} R_i$ , and let  $f$  denote an unknown fuzzy subset of  $A$ . Then:

$$\langle f \circ R_i = f \mid i \in I \rangle \subseteq \langle f \circ R = f \rangle, \quad \langle R_i \circ f = f \mid i \in I \rangle \subseteq \langle R \circ f = f \rangle, \quad (3)$$

and the inclusions may be proper.

## Theorem

Let  $R$  be a fuzzy relation on a set  $A$ , and let  $f$  denote an unknown fuzzy subset of  $A$ . Then:

$$\langle f \circ R = f \rangle = \langle f \circ R^t = f \rangle, \quad \langle R \circ f = f \rangle = \langle R^t \circ f = f \rangle. \quad (4)$$

## Remark

$\langle f \circ R_i = f \mid i \in I \rangle$  and  $\langle R_i \circ f = f \mid i \in I \rangle$  form *opening systems*, but *not necessarily closure systems*

## Computation of the greatest solutions

**Algorithm 1 (Ignjatović, Ćirić, De Baets)**

general method for solving equations defined by *residuated* and *residual functions*  
 $f \circ R_i = f$  ( $i \in I$ ) – defined by residuated functions  $f \mapsto f \circ R_i$  and  $f \mapsto f$

$$\langle f \circ R_i = f \mid i \in I \rangle = \left\langle f \leq \bigwedge_{i \in I} (f \circ R_i \wedge f / R_i) \right\rangle$$

computation of the *greatest post-fixed point* of an isotone function on  $\mathcal{F}(A)$   
*iterative procedure* (the number of iterations may be infinite, for some structures)

**Algorithm 2 (Jiménez, Montes, Šešelja, Tepavčević, 2011)**

compute the greatest solution to  $f \circ R = f, f \leq g$  ( $R$  and  $g$  are given)

‣ compute the greatest solution  $h$  to  $f \circ R \leq f, f \leq g$  ( $h = g / R^q$ )

‣ build a sequence  $\{h_n\}_{n \in \mathbb{N}}$  of fuzzy sets by:  $h_1 = h, h_{n+1} = h_n \circ R = h \circ R^n$

‣ if  $h_n = h_{n+1}$ , for some  $n \in \mathbb{N}$ , then  $h_n$  is the solution we were looking for

under what conditions the sequence  $\{h_n\}_{n \in \mathbb{N}}$  is finite?
