

A survey of homogeneous effect algebras

Gejza Jenča

June 23, 2014

Effect algebras

(Foulis and Bennett 1994, Chovanec and Kôpka 1994, Giuntini and Greuling 1989)

An effect algebra is a partial algebra $(E; \oplus, 0, 1)$ with a binary partial operation \oplus and two nullary operations $0, 1$ satisfying the following conditions.

- (E1) If $a \oplus b$ is defined, then $b \oplus a$ is defined and $a \oplus b = b \oplus a$.
- (E2) If $a \oplus b$ and $(a \oplus b) \oplus c$ are defined, then $b \oplus c$ and $a \oplus (b \oplus c)$ are defined and $(a \oplus b) \oplus c = a \oplus (b \oplus c)$.
- (E3) For every $a \in E$ there is a unique $a' \in E$ such that $a \oplus a' = 1$.
- (E4) If $a \oplus 1$ exists, then $a = 0$

Basic Relationships

Let E be an effect algebra.

- ▶ Cancellativity: $a \oplus b = a \oplus c \Rightarrow b = c$.
- ▶ Partial difference: If $a \oplus b = c$ then we write $a = c \ominus b$. \ominus is well defined and $a' = 1 \ominus a$.
- ▶ Poset: Write $b \leq c$ iff $\exists a : a \oplus b = c$; (E, \leq) is then a bounded poset.
- ▶ Domain of \oplus : $a \oplus b$ is defined iff $a \leq b'$ iff $b \leq a'$.

Morphisms

Definition

Let E, F be effect algebras, let $\phi : E \rightarrow F$. We say that ϕ is a morphism of effect algebras iff

- ▶ $\phi(1) = 1$ and
- ▶ for all $a, b \in E$ such that $a \oplus b$ exists in E , $\phi(a) \oplus \phi(b)$ exists in F and $\phi(a \oplus b) = \phi(a) \oplus \phi(b)$

Motivation

- ▶ In 1990s, effect algebras were introduced.

Motivation

- ▶ In 1990s, effect algebras were introduced.
- ▶ Soon it was discovered that effect algebras generalize both orthoalgebras (quantum logics) and MV-algebras (fuzzy logics).

Motivation

- ▶ In 1990s, effect algebras were introduced.
- ▶ Soon it was discovered that effect algebras generalize both orthoalgebras (quantum logics) and MV-algebras (fuzzy logics).
- ▶ People started to wonder how to generalize various parts of the theory of quantum logics to effect algebras, with varying success.

Motivation

- ▶ The notion of compatibility is very important in quantum logics, so it was natural to try to extend the theory of compatible sets from quantum logics.
- ▶ However, the general case appears to be very difficult.
- ▶ Next idea: try to find some conditions under which compatible sets behave sanely.

Compatibility

definition

Definition

- ▶ A finite subset A of an effect algebra E is compatible if and only if there is a finite Boolean algebra B and a morphism of effect algebras such that $A \subseteq \phi(B)$.

Compatibility

definition

Definition

- ▶ A finite subset A of an effect algebra E is compatible if and only if there is a finite Boolean algebra B and a morphism of effect algebras such that $A \subseteq \phi(B)$.
- ▶ A subset of A an effect algebra is compatible if and only if every finite subset of A is compatible.

Orthogonality, covers

Definition

- ▶ A finite sequence of elements $\mathbf{b} = (b_1, \dots, b_n)$ of an effect algebra is called an orthogonal word if $b_1 \oplus \dots \oplus b_n$ exists.

Orthogonality, covers

Definition

- ▶ A finite sequence of elements $\mathbf{b} = (b_1, \dots, b_n)$ of an effect algebra is called an orthogonal word if $b_1 \oplus \dots \oplus b_n$ exists.
- ▶ An orthogonal word \mathbf{b} of elements of an effect algebra is called a decomposition of unit if $b_1 \oplus \dots \oplus b_n = 1$.

Orthogonality, covers

Definition

- ▶ A finite sequence of elements $\mathbf{b} = (b_1, \dots, b_n)$ of an effect algebra is called an orthogonal word if $b_1 \oplus \dots \oplus b_n$ exists.
- ▶ An orthogonal word \mathbf{b} of elements of an effect algebra is called a decomposition of unit if $b_1 \oplus \dots \oplus b_n = 1$.
- ▶ An element a is covered by \mathbf{b} if and only if a is a sum of a subsequence of \mathbf{b} .

Orthogonality, covers

Definition

- ▶ A finite sequence of elements $\mathbf{b} = (b_1, \dots, b_n)$ of an effect algebra is called an orthogonal word if $b_1 \oplus \dots \oplus b_n$ exists.
- ▶ An orthogonal word \mathbf{b} of elements of an effect algebra is called a decomposition of unit if $b_1 \oplus \dots \oplus b_n = 1$.
- ▶ An element a is covered by \mathbf{b} if and only if a is a sum of a subsequence of \mathbf{b} .
- ▶ There is an obvious preorder relation, called refinement on the set of all decomposition of unit: “replace every b_i by an orthogonal word with sum equal to b_i .”

Compatibility

characterization

Proposition

A finite subset A of an effect algebra E is compatible if and only if there is a decomposition of unit \mathbf{b} , such that \mathbf{b} covers every element of A .

Lattice effect algebras are nice

- ▶ In [Rie00], Zdenka Riečanová proved a surprising theorem.

Theorem

Every maximal compatible subset (a block) of a lattice effect algebra E is an MV-algebra that is both a sublattice and a subeffect algebra of E .

- ▶ That means that lattice effect algebras look like orthomodular lattices, but their blocks are MV-algebras instead of Boolean algebras.

The problem

- ▶ There are two important types of quantum logics that were studied long before effect algebras and allowed for a notion of a block: orthomodular posets and orthoalgebras.

The problem

- ▶ There are two important types of quantum logics that were studied long before effect algebras and allowed for a notion of a block: orthomodular posets and orthoalgebras.
- ▶ These are, in general, not lattice ordered.

The problem

- ▶ There are two important types of quantum logics that were studied long before effect algebras and allowed for a notion of a block: orthomodular posets and orthoalgebras.
- ▶ These are, in general, not lattice ordered.
- ▶ Is there a class of effect algebras that

The problem

- ▶ There are two important types of quantum logics that were studied long before effect algebras and allowed for a notion of a block: orthomodular posets and orthoalgebras.
- ▶ These are, in general, not lattice ordered.
- ▶ Is there a class of effect algebras that
 - ▶ includes lattice effect algebras,
 - ▶ includes orthoalgebras and
 - ▶ allows for a meaningful theory of compatibility and a notion of block?

The solution

- ▶ In general, it may happen that the elements covered by a decomposition of unit are not closed with respect to \oplus , \ominus .

The solution

- ▶ In general, it may happen that the elements covered by a decomposition of unit are not closed with respect to \oplus , \ominus .
- ▶ It may happen even in a lattice effect algebra.

The solution

- ▶ In general, it may happen that the elements covered by a decomposition of unit are not closed with respect to \oplus , \ominus .
- ▶ It may happen even in a lattice effect algebra.
- ▶ But we do not need that.

The solution

- ▶ In general, it may happen that the elements covered by a decomposition of unit are not closed with respect to \oplus , \ominus .
- ▶ It may happen even in a lattice effect algebra.
- ▶ But we do not need that.
- ▶ What we need is the following:

The solution

- ▶ In general, it may happen that the elements covered by a decomposition of unit are not closed with respect to \oplus , \ominus .
- ▶ It may happen even in a lattice effect algebra.
- ▶ But we do not need that.
- ▶ What we need is the following:

The solution

- ▶ In general, it may happen that the elements covered by a decomposition of unit are not closed with respect to \oplus , \ominus .
- ▶ It may happen even in a lattice effect algebra.
- ▶ But we do not need that.
- ▶ What we need is the following:
 - ▶ if we have a finite compatible set, covered by a decomposition of unit and
 - ▶ we have some x, y in the compatible set with $x \leq y$, then

The solution

- ▶ In general, it may happen that the elements covered by a decomposition of unit are not closed with respect to \oplus , \ominus .
- ▶ It may happen even in a lattice effect algebra.
- ▶ But we do not need that.
- ▶ What we need is the following:
 - ▶ if we have a finite compatible set, covered by a decomposition of unit and
 - ▶ we have some x, y in the compatible set with $x \leq y$, then
 - ▶ we want to refine the decomposition of unit so that the finer decomposition of unit will cover $y \ominus x$.

The idea behind the definition

Definition

[Jen01]

- ▶ An effect algebra is homogeneous iff $u \leq v_1 \oplus \dots \oplus v_n \leq u'$ implies that there exist $u_1, \dots, u_n \in E$ such that $u_i \leq v_i$ and $u = u_1 \oplus \dots \oplus u_n$.
- ▶ It is easy to prove that an effect algebra is homogeneous if and only if it satisfies the above condition with fixed $n = 2$.

An example of a “genuine” homogeneous effect algebra

Example

Let μ be the Lebesgue measure on $[0, 1]$. Let $E \subseteq [0, 1]^{[0,1]}$ be such that, for all $f \in E$,

(a) f is measurable

(b) $\mu(\text{supp}(f)) \in \mathbb{Q}$

(c) $\mu(\{x \in [0, 1] : f(x) \notin \{0, 1\}\}) = 0$,

where $\text{supp}(f)$ denotes the support of f . Then E is a homogeneous effect algebra which is not lattice ordered, not an orthoalgebra and does not satisfy the Riesz decomposition property.

Where does the name come from?

The characterization of finite homogeneous effect algebras

[Jen03]: a finite effect algebra E is homogeneous if and only if it satisfies the following condition.

- ▶ For every pair of decompositions of unit \mathbf{b}, \mathbf{c} ,

Where does the name come from?

The characterization of finite homogeneous effect algebras

[Jen03]: a finite effect algebra E is homogeneous if and only if it satisfies the following condition.

- ▶ For every pair of decompositions of unit \mathbf{b}, \mathbf{c} ,
- ▶ such both \mathbf{b} and \mathbf{c} consist solely of atoms of E ,

Where does the name come from?

The characterization of finite homogeneous effect algebras

[Jen03]: a finite effect algebra E is homogeneous if and only if it satisfies the following condition.

- ▶ For every pair of decompositions of unit \mathbf{b}, \mathbf{c} ,
- ▶ such both \mathbf{b} and \mathbf{c} consist solely of atoms of E ,
- ▶ and every atom d occurring at least once in both \mathbf{b} and \mathbf{c} ,

Where does the name come from?

The characterization of finite homogeneous effect algebras

[Jen03]: a finite effect algebra E is homogeneous if and only if it satisfies the following condition.

- ▶ For every pair of decompositions of unit \mathbf{b}, \mathbf{c} ,
- ▶ such both \mathbf{b} and \mathbf{c} consist solely of atoms of E ,
- ▶ and every atom d occurring at least once in both \mathbf{b} and \mathbf{c} ,
- ▶ the number of occurrences of d in \mathbf{b} is equal to the number of occurrence of d in \mathbf{c} .

Where does the name come from?

The characterization of finite homogeneous effect algebras

[Jen03]: a finite effect algebra E is homogeneous if and only if it satisfies the following condition.

- ▶ For every pair of decompositions of unit \mathbf{b}, \mathbf{c} ,
- ▶ such both \mathbf{b} and \mathbf{c} consist solely of atoms of E ,
- ▶ and every atom d occurring at least once in both \mathbf{b} and \mathbf{c} ,
- ▶ the number of occurrences of d in \mathbf{b} is equal to the number of occurrence of d in \mathbf{c} .

This characterization was recently extended to orthocomplete atomic case in [Ji14].

Compatibility and blocks in HEAs

- ▶ There is a slightly stronger notion of internal compatibility needed.

Compatibility and blocks in HEAs

- ▶ There is a slightly stronger notion of internal compatibility needed.
- ▶ Maximal internally compatible subsets of homogeneous effect algebras are subalgebras, so we have a notion of a block.

Compatibility and blocks in HEAs

- ▶ There is a slightly stronger notion of internal compatibility needed.
- ▶ Maximal internally compatible subsets of homogeneous effect algebras are subalgebras, so we have a notion of a block.
- ▶ In general, the blocks of homogeneous effect algebras are not MV-algebras.

Compatibility and blocks in HEAs

- ▶ There is a slightly stronger notion of internal compatibility needed.
- ▶ Maximal internally compatible subsets of homogeneous effect algebras are subalgebras, so we have a notion of a block.
- ▶ In general, the blocks of homogeneous effect algebras are not MV-algebras.
- ▶ However, they satisfy Riesz decomposition property:

$$u \leq v_1 \oplus v_2 \implies u = u_1 \oplus u_2, \text{ where } u_i \leq v_i$$

Compatibility and blocks in HEAs

- ▶ There is a slightly stronger notion of internal compatibility needed.
- ▶ Maximal internally compatible subsets of homogeneous effect algebras are subalgebras, so we have a notion of a block.
- ▶ In general, the blocks of homogeneous effect algebras are not MV-algebras.
- ▶ However, they satisfy Riesz decomposition property:

$$u \leq v_1 \oplus v_2 \implies u = u_1 \oplus u_2, \text{ where } u_i \leq v_i$$

- ▶ If ϕ is a morphism from a Boolean algebra into a homogeneous effect algebra, then the range of ϕ is a subset of a block.

Sharp elements in HEAs

- ▶ An element a of an effect algebra is sharp if and only if $a \wedge a' = 0$.

Sharp elements in HEAs

- ▶ An element a of an effect algebra is sharp if and only if $a \wedge a' = 0$.
- ▶ The set of all sharp elements in a homogeneous effect algebra forms a subalgebra.

Questions

Let E be a homogeneous effect algebra.

- ▶ How does the system of all blocks of E (and their intersections) look like?

Questions

Let E be a homogeneous effect algebra.

- ▶ How does the system of all blocks of E (and their intersections) look like?
- ▶ Does it look (in some sense) like in some orthoalgebra?

Questions

Let E be a homogeneous effect algebra.

- ▶ How does the system of all blocks of E (and their intersections) look like?
- ▶ Does it look (in some sense) like in some orthoalgebra?
- ▶ What if we have a lattice effect algebra?

Questions

Let E be a homogeneous effect algebra.

- ▶ How does the system of all blocks of E (and their intersections) look like?
- ▶ Does it look (in some sense) like in some orthoalgebra?
- ▶ What if we have a lattice effect algebra?
- ▶ Does it look like some orthomodular lattice?

The finite case

Theorem

[Jen03] For every finite homogeneous effect algebra E there is an orthoalgebra $O(E)$ and a surjective morphism of effect algebras $\phi : O(E) \rightarrow E$ such that

The finite case

Theorem

[Jen03] For every finite homogeneous effect algebra E there is an orthoalgebra $O(E)$ and a surjective morphism of effect algebras $\phi : O(E) \rightarrow E$ such that

- ▶ for every block B of $O(E)$, $\phi(B)$ is a block of E and

The finite case

Theorem

[Jen03] For every finite homogeneous effect algebra E there is an orthoalgebra $O(E)$ and a surjective morphism of effect algebras $\phi : O(E) \rightarrow E$ such that

- ▶ for every block B of $O(E)$, $\phi(B)$ is a block of E and
- ▶ for every block M of E , $\phi^{-1}(M)$ is a block of $O(E)$.

The finite case

Theorem

[Jen03] For every finite homogeneous effect algebra E there is an orthoalgebra $O(E)$ and a surjective morphism of effect algebras $\phi : O(E) \rightarrow E$ such that

- ▶ for every block B of $O(E)$, $\phi(B)$ is a block of E and
- ▶ for every block M of E , $\phi^{-1}(M)$ is a block of $O(E)$.

Moreover, if E is a lattice then $O(E)$ is a lattice.

The infinite case

MV-algebras

Theorem

[Jen04a] For every MV-algebra M there is a Boolean algebra $B(M)$ and a surjective morphism of effect algebras $\phi_M : B(M) \rightarrow M$.

The infinite case

MV-algebras

Theorem

[Jen04a] For every MV-algebra M there is a Boolean algebra $B(M)$ and a surjective morphism of effect algebras $\phi_M : B(M) \rightarrow M$.

Side note: the maps ϕ_M are a components of a natural transformation between two functors from the category of MV-algebras to the category of MV-effect algebras.

The orthocomplete case

- ▶ An effect algebra is orthocomplete if every maximal chain is a complete lattice.

The orthocomplete case

- ▶ An effect algebra is orthocomplete if every maximal chain is a complete lattice.
- ▶ This condition can be expressed in terms of infinite sums.

The orthocomplete case

- ▶ An effect algebra is orthocomplete if every maximal chain is a complete lattice.
- ▶ This condition can be expressed in terms of infinite sums.
- ▶ A lattice effect algebra is orthocomplete if and only if it is complete.

The orthocomplete case

- ▶ I do not know how to construct $O(E)$ for a general HEA E .

The orthocomplete case

- ▶ I do not know how to construct $O(E)$ for a general HEA E .
- ▶ In the finite case, the proof is based on an interplay between atoms and sharp elements.

The orthocomplete case

- ▶ I do not know how to construct $O(E)$ for a general HEA E .
- ▶ In the finite case, the proof is based on an interplay between atoms and sharp elements.
- ▶ After taking appropriate generalizations, it turns out that the core problem is to describe the interaction between sharp elements, compatibility and blocks.

Sharp kernels and blocks

Theorem

[Jen04b] Let E be a orthocomplete homogeneous effect algebra.

- ▶ *For every element x of E , there is the greatest sharp element over x , denoted by x^\downarrow .*

Sharp kernels and blocks

Theorem

[Jen04b] Let E be a orthocomplete homogeneous effect algebra.

- ▶ For every element x of E , there is the greatest sharp element over x , denoted by x^\downarrow .
- ▶ If B is a block of E and $x \in B$, then for every y such that $x^\downarrow \leq y \leq x$ we have $y \in B$.

Sharp kernels and blocks

Theorem

[Jen04b] Let E be a orthocomplete homogeneous effect algebra.

- ▶ For every element x of E , there is the greatest sharp element over x , denoted by x^\downarrow .
- ▶ If B is a block of E and $x \in B$, then for every y such that $x^\downarrow \leq y \leq x$ we have $y \in B$.

Meager elements

- ▶ An element m of an effect algebra is meager if 0 is the only sharp element under m .

Meager elements

- ▶ An element m of an effect algebra is meager if 0 is the only sharp element under m .
- ▶ For every element x in an orthocomplete HEA, $x \ominus x^\downarrow$ is meager.

Triple representation for complete LEAs

Theorem

[Jen04b] *Every complete lattice effect algebra is completely characterized by the following data*

- ▶ *The orthomodular lattice $S(E)$ of sharp elements.*

¹Like EA, but without the unit

Triple representation for complete LEAs

Theorem

[Jen04b] *Every complete lattice effect algebra is completely characterized by the following data*

- ▶ *The orthomodular lattice $S(E)$ of sharp elements.*
- ▶ *The generalized effect algebra¹ $M(E)$ of meager elements.*

¹Like EA, but without the unit

Triple representation for complete LEAs

Theorem

[Jen04b] Every complete lattice effect algebra is completely characterized by the following data

- ▶ The orthomodular lattice $S(E)$ of sharp elements.
- ▶ The generalized effect algebra¹ $M(E)$ of meager elements.
- ▶ The mapping s from $S(E)$ to the ideal lattice of $M(E)$:

$$s(x) = \{y \in M(E) : y \leq x\}$$

¹Like EA, but without the unit

Triple representation for orthocomplete HEAs

- ▶ In my paper, I failed to prove a triple representation theorem for orthocomplete HEAs.

Triple representation for orthocomplete HEAs

- ▶ In my paper, I failed to prove a triple representation theorem for orthocomplete HEAs.
- ▶ The proof was recently found by Paseka and Niederle in [NP12].

More nice things proved by Paseka and Niederle

[NP12, NP13a, NP13b]

- ▶ The blocks of orthocomplete HEAs are lattice ordered (hence they are MV-algebras).

More nice things proved by Paseka and Niederle

[NP12, NP13a, NP13b]

- ▶ The blocks of orthocomplete HEAs are lattice ordered (hence they are MV-algebras).
- ▶ Some of the results can be extended to more general classes, like
 - ▶ meager-orthocomplete and sharply dominating (this includes all orthoalgebras)
